

Automata and Formal Languages. Homework 9 (11.11.2024)

1. Let L be the language generated by the grammar $(\{S\}, \{a, b\}, P, S)$ where P contains the productions $S \rightarrow aSSa \mid SbbS \mid \varepsilon$. Moreover, let $h : \{a, b\}^* \rightarrow \{a, b\}^*$ be the homomorphism defined by $h(a) = ab$ and $h(b) = ba$. Construct a context-free grammar that generates the language $h(L^*) \cup LL$.
2. Is the family of context-free languages closed under the following language operations? Prove.
 - (a) $\text{Palindrome}(L) = \{w \mid w \in L \text{ and } w \text{ is a palindrome}\}$.
 - (b) $L^R = \{w \mid w^R \in L\}$.
 - (c) $\text{Half}(L) = \{w \mid ww \in L\}$.
 - (d) $\text{Pref}(L) = \{w \mid wu \in L \text{ for some word } u\}$.
3. Let $L = \{a^n b^m c^k \mid m \neq n \text{ or } m \neq k\}$. Prove that L is context-free but its complement is not context-free.
4. Prove that $L = b^* c^* d^* \cup \{a^n b^m c^m d^m \mid n, m \geq 0\}$ is a non-context-free language that satisfies the pumping lemma of context-free languages.
5. Let

$$L_1 = \{a^{2n} b^n \mid n \geq 1\}^* \text{ and}$$

$$L_2 = \{b^n a^n \mid n \geq 1\}^* b.$$
 (Note the Kleene closure.) Prove that L_1 and L_2 are context-free but their quotient L_1/L_2 is not context-free.
6. For any language $L \subseteq \Sigma^*$, we define

$$\text{Shuffle}(L) = \{w \in \Sigma^* \mid \exists u \in L : w \text{ is obtained from } u \text{ by permuting its letters}\}$$
 to be the language of words that can be obtained by re-ordering the letters in the words of L . (Recall Problem 3 in homework set #4.)
 - (a) Prove that there is a regular language L over the three letter alphabet $\{a, b, c\}$ such that $\text{Shuffle}(L)$ is not context free.
 - (b) Prove that if $\Sigma = \{a, b\}$ and L is regular then $\text{Shuffle}(L)$ is context-free.
7. Show that there are algorithms that solve the following problems. (Hint: use effective closure properties and known algorithms from the lecture notes)
 - (a) Does a given context-free grammar generate a word that contains aba as a subword?
 - (b) Does every word generated by a given context-free grammar contain subword aba ?
 - (c) Does a given regular language contain infinitely many palindromes?
