## University of Turku / Department of Mathematics and Statistics SCIENTIFIC COMPUTING Exercise 04, 5.10.2016

**N.B.** The files mentioned in the exercises (if any) are available on the course homepage

1. (a) Let X and Y be independent uniformly distributed random variables on (0, 1). As we know, samples of X can be generated by x= rand(1,100); for instance. Now it is a basic fact (this need not be proven) that the new random variables

$$U=\cos(2\pi X)\sqrt{-2\log Y}; \quad V=\sin(2\pi X)\sqrt{-2\log Y}$$

follow the normal distribution with parameters (0, 1), i.e. with mean 0 and variance 1. Use this so called Box-Müller method to generate 200 samples of normal distribution, plot the result with the command hist, compute the mean and standard deviation of the sample.

(b) The amplitude distribution of a signal sent by a mobile phone to a base station follows so called Rayleigh distribution. Suppose that  $X_1, X_2$ are zero-mean normally distributed random variables with variance  $\sigma^2$  and define a new random variable R by  $R = \sqrt{X_1^2 + X_2^2}$ . Then R follows the Rayleigh distribution. Generate 100 samples of a Rayleigh distribution and plot the histogram.

2. Suppose that  $f: [a, b] \to [0, \infty)$  is continuous and that  $0 \le f(x) \le M$  for all  $x \in [a, b]$ . Use the Monte Carlo method to approximate the value of

$$\int_a^b f(x)\,dx,$$

that is, choose m random points in  $[a, b] \times [0, M]$  and compute the ratio p/m where p is the number of points below the graph of f(x). Apply this method for the function

$$f(x)=\sum_{j=1}^n c_j(1+\sin(d_jx))$$

FILE: ~/mme2016/d04/d04.tex — 6. syyskuuta 2016 (klo 17.08).

in [0,1] with m = 10j, j = 10: 10: 100 where n = 4, c=rand(1,n), d= 1+3\*rand(1,n). Compare your result to the exact value

$$\int_{a}^{b} f(x) dx = (b-a) \sum_{j=1}^{n} c_{j} + \sum_{j=1}^{n} (c_{j}/d_{j}) (\cos(d_{j} * a) - \cos(d_{j} * b)) \, ,$$

see Problem 3/Exercise 2.

3. The ASCII codes of capital letters A,...,Z are 65,...,90. A simple ciphering method, so called Caesar cipher, is the following. Fix an integer  $p \in [1, 25]$ . Each letter is replaced by another, obtained by increasing its ASCII code by the constant p. (Note that we recycle: 91 corresponds to 65 i.e. after Z come A,B,C,...). The program hlp043.m shows how this happens. Use this idea to decipher the message:

Q C A D I H C S F U C G I A

4. We want to fit a model of the form  $f(x) = ae^{bx}$  to the data set

x 1 3 4 6 9 15 y 4.0 3.5 2.9 2.5 2.75 2.0

where a and b are parameters to be determined from the data.

(a) For this purpose we introduce new transformed variables X = x,  $Y = \log(y)$ . Carry out this data transformation and print out the transformed variables.

(b) After the transformation the new model is  $F(x) = \log f(x) = bx + \log a$ . Apply the usual LSQ method to find b and  $\log a$ .

(c) Print the results in the following format

x(i) y(i) Y(i) a\*exp(b\*x(i)) y(i)-a\*exp(b\*x(i)) 1 4.0 .... 15 2.0

and plot the data and the fitted curve in the same figure.

**5.** For a complex  $n \times n$  matrix a let  $P_i = \sum_{j=1, j \neq i}^n |a_{i,j}|$ ,  $m_0 = \min\{|a_{i,i}| - P_i : i = 1, ..., n\}$ ,  $m = \max\{m_0, 0\}$ ,  $M = \max\{|a_{i,i}| + P_i : i = 1, ..., n\}$ .

By Gerschgorin's theorem (recall Exercise 03) the eigenvalues  $\lambda_i$  of a satisfy

$$m \leq |\lambda_i| \leq M; \quad i=1,...,n$$

and it also follows that  $m^n \leq D \leq M^n$ ,  $D = |\det(a)|$ . Set  $m_1 = \min\{|\lambda_i| : i = 1, ..., n\}$  and  $m_2 = \max\{|\lambda_i| : i = 1, ..., n\}$ . Write a MATLAB script that experimentally confirms these statements, by printing out the test results in the following format

n m m1 m2 M D - m^n M^n -D

Use random complex  $n \times n$  matrices, n=5:5:50.

Repeat the experiment for the matrices  $a=2^n*eye(n)+rand(n,n)+i*rand(n,n)$ .

6. The arithmetic-geometric mean ag(a, b) of two positive numbers a > b > 0 is defined as  $ag(a, b) = \lim a_n$ , where  $a_0 = a, b_0 = b$ , and

$$a_{n+1} = (a_n + b_n)/2, \quad b_{n+1} = \sqrt{a_n b_n}, \quad n = 0, 1, 2, \dots$$

(a) Write a function, which takes two arguments (double), computes ag and returns the value (double).

(b) The hypergeometric function  $_2F_1(a, b; c; x)$  is defined as a sum of the series,

$${}_2F_1(a,b;c;x) = 1 + rac{ab}{c}rac{x}{1!} + rac{a(a+1)b(b+1)}{c(c+1)}rac{x^2}{2!} + \dots \ + rac{a(a+1)\dots(a+j-1)b(b+1)\dots(b+j-1)}{c(c+1)\dots(c+j-1)}rac{x^j}{j!} + \dots \ .$$

This hypergeometric series converges for abs x < 1. Gauss proved in 1799 that there is a connection between the hypergeometric function and the arithmetic-geometric mean,

$$_{2}F_{1}(rac{1}{2},rac{1}{2};1;r^{2})=rac{1}{rag(1,\sqrt{1-r^{2}})}$$

for 0 < r < 1. Tabulate the difference of the two sides of this identity for r = 0.05k, k = 1, ..., 19. Use the routine on the web-page to calculate the values of the  $_2F_1$  or the MATLAB built-in program (help hypergeom).
